Vertebroplasty Effectiveness Assessment

Rheological Model for Non-Newtonian Fluid Flow in Vertebral Trabecular Bone

- Darcy flow:

$$\underline{q} = \frac{k^s}{\bar{\mu}} \nabla p$$

- Reynolds number \bar{Re} :

$$\bar{Re} = 4 \frac{\rho \|\underline{q}\|}{\bar{\mu} S_v}$$

- Normalized Navier Stokes:

$$-\text{Re} \nabla p' + \nabla^2 \underline{u}' = \text{Re} (\underline{u}' \cdot \nabla) \underline{u}'$$

$$\nabla \cdot \underline{u}' = 0$$

- Reynolds number Re :

$$Re = \frac{\rho u_0^{2-n} D^n}{C}$$

$$\bar{Re} = \frac{\iiint \text{Re}(x, y, z) dx dy dz}{\iiint dx dy dz}$$

Slattery-Whitaker theorem
S. Whitaker et al., 1969

Experimental Validation

Experiments performed at the Istituto Ortopedico Rizzoli, Bologna, with the support of L. Cristofolini

Experimental vs. Predicted Cement Pattern

Experiment
 Simulation Common volume

Sagittal plane

Transerve plane

Coronal plane

Results – Error Quantification (Hausdorff Distance)

$$\text{RMS}(e_d) = 1.6778 \text{ mm}$$

Results – Significance of Error Improvement

Prediction errors of the anatomical groups

Prediction errors of the intermixed groups

Experimental Validation – Surrogate-Bones

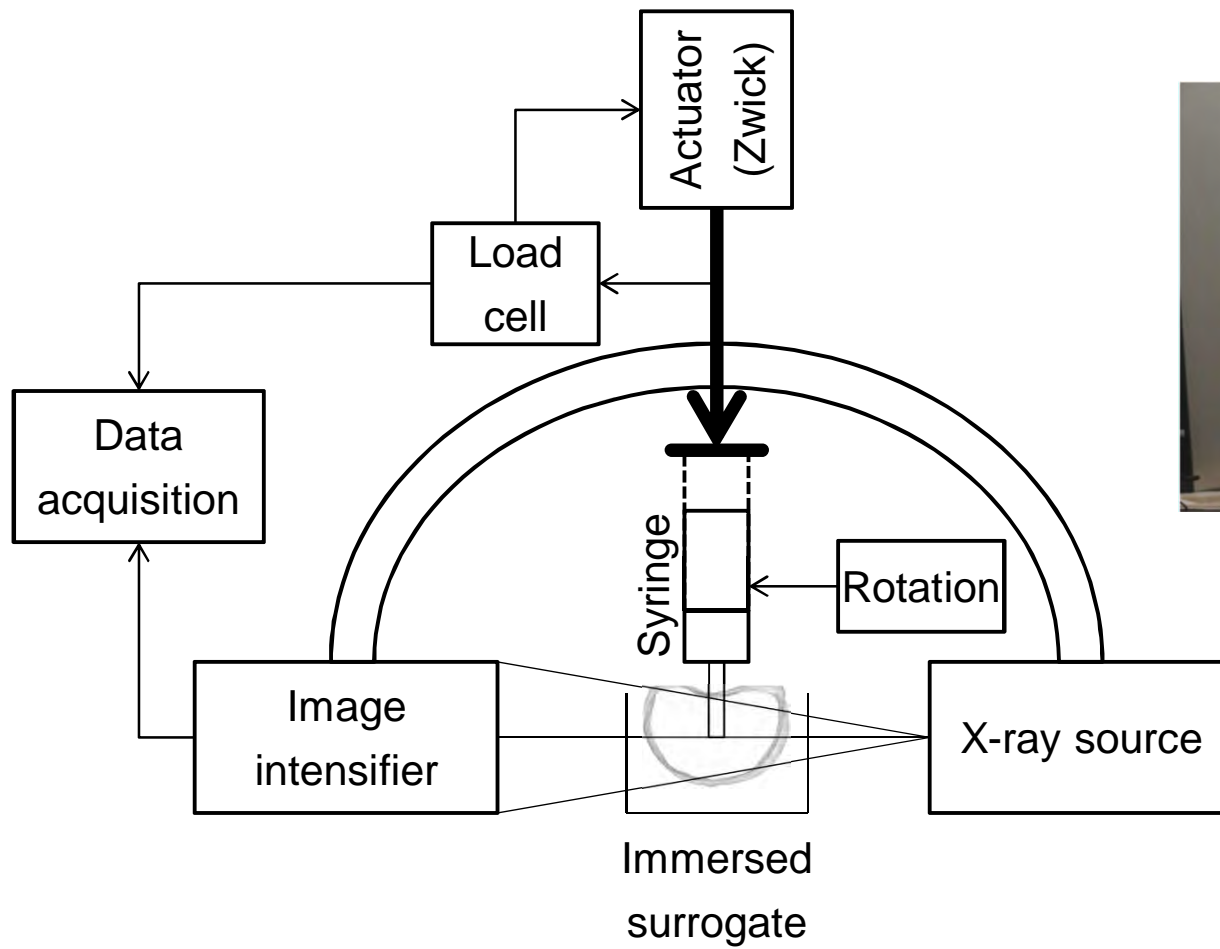

- Specific aims
 - Evaluation of bone cement and marrow substitutes
 - Design of an experimental setup to perform injections under multi-planar fluoroscopy
 - 3D-Reconstruction of the spreading pattern
 - Quantitative comparison to computational flow simulations
- Vertebral body surrogates fabricated by 3D printing technologies¹ (EUR 640.-/sample)

Surrogatebone

¹Inspire, www.inspire.ethz.ch

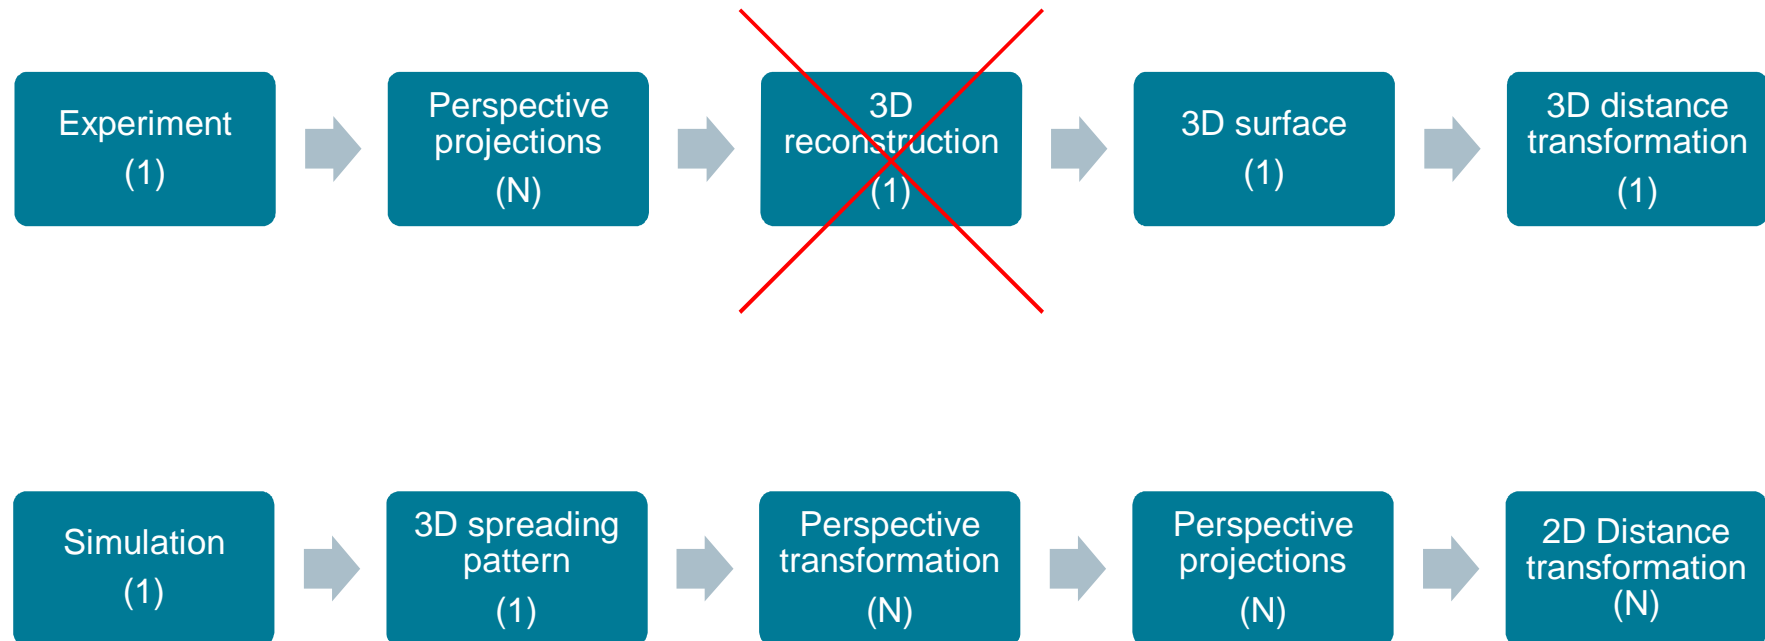

Experimental Setup

Flow Simulations

- Tetrahedral mesh derived from downsampled μ CT stack (approx. 100K elements)
- BVTV, DA, Tb.Sp and Tb.Th
 - determined for cubic regions
 - evaluated at nodes of FE mesh
 - Interpolated to integration points
- Simulations performed
 - 2 specimens (#4022 L1 and #4024 L1)
 - 4 permeability models
 - BVTV ("BVTV")
 - BVTV + DA ("DA")
 - BVTV + DA + Tb.Sp ("Tb.Sp")
 - BVTV + DA + Tb.Sp + Tb.Th ("Tb.Th")

3D Reconstruction vs. Fluoroscopy Simulation

Perspective Registration

- Transformation model:

$$\underbrace{\begin{pmatrix} x' \\ y' \\ 1 \end{pmatrix}}_{\underline{x'}} = \underbrace{\begin{pmatrix} a_{11} & a_{12} & a_{13} & a_{14} \\ a_{21} & a_{22} & a_{23} & a_{24} \\ 0 & 0 & 0 & 1 \end{pmatrix}}_T \cdot \underbrace{\begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}}_{\underline{x}}$$

- T : Transformation matrix
- \underline{x} : 3D **center of mass points** in simulation domain
- \underline{x}' : 2D **center of mass points** in experimental domain
- Solve for T

Perspective Projections

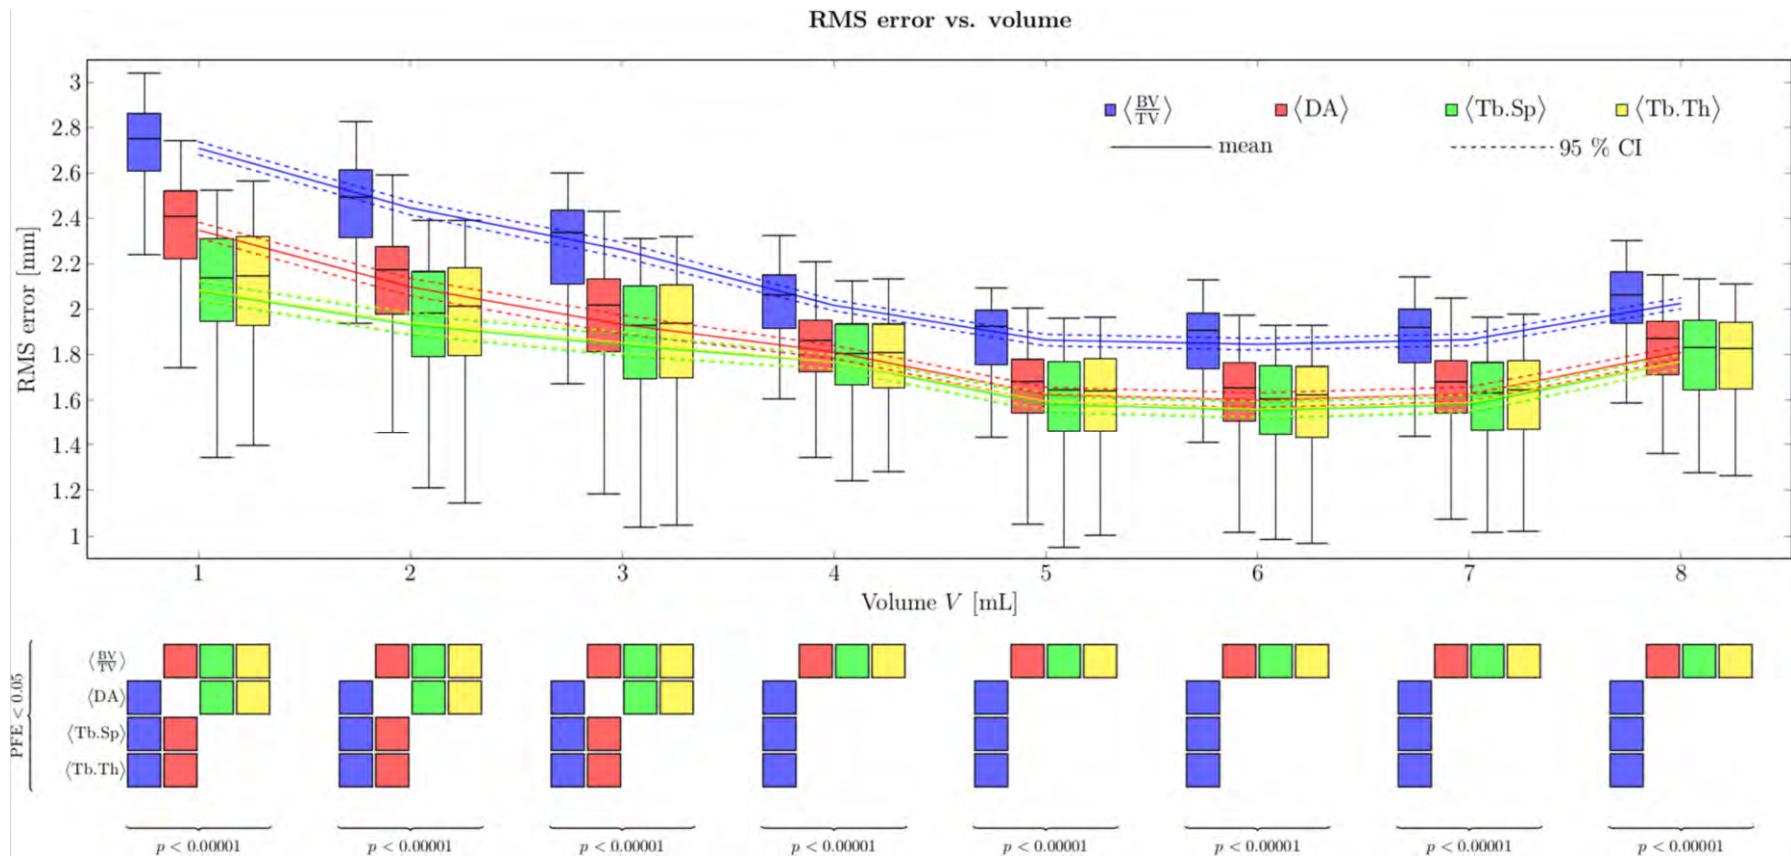

Error Estimation

- Distance transformation:
 $\varepsilon = DT(\text{red}, \text{green})$
- DT: Distance transformation
- **Red:** Outline of **predicted** cement bolus projection
- **Green:** Outline of **estimated** cement bolus projection

RMS Error vs. Morphological Information

Discussion / Conclusions

- 3D reconstruction from fluoroscopy data delicate task
- Validation indicates RMS prediction error of 2...3 mm
- $\approx 2x$ RMS error of cadaveric study
 - registration error
 - micro-architectural mismatch of the bone surrogates
 - non-Newtonian fluid models
- Error depends on
 - injection volume (smaller if cement boundary is far away from inlet and outlet regions)
 - permeability model
- **Costs**
